Questions And with ...

Answer 2 False

Explanation: There is no concept of power factor improvement in DC Circuits because the phase angle (θ) between Current (I) and voltage (V) is 0 and the then power factor becomes $\text{Cos } \theta = 1$. So power factor in DC Circuits is 1 and Only 1. In other words there is no reactive component in DC Circuits so the power

A circuit breaker in series before the parallel branches can prevent overloads by automatically opening the circuit. A 15 A circuit operating at 120 V consumes 1,800 W of total power. $P = VI = (120 \text{ V})(15 \text{ A}) = 1,800 \text{ W}$. Total power in a parallel circuit is the sum of the power consumed on the individual branches.
