Type II DNA topoisomerase enzymes (TOP2) catalyze topological changes by strand passage reactions. They involve passing one intact double stranded DNA duplex through a transient enzyme-bridged break in another (gated helix) followed by ligation of the break by TOP2. A TOP2 poison, etoposide blocks TOP2 catalysis at the ligation step of the enzyme-bridged break, increasing the number of stable ...

DNA Topoisomerase Protocols Volume I

All cells have two major forms of topoisomerases: the type I enzymes, which make single-stranded cuts in DNA, and the type II enzymes, which cut and pass double-stranded DNA. In this unit, an in vitro assay for topoisomerase I activity based on relaxation of supercoiled DNA by that enzyme is described.

Recent molecular studies have expanded the biological contexts in which topoisomerase II (TOP2) has crucial functions, including DNA replication, transcription and chromosome segregation. Although the biological functions of TOP2 are important for ensuring genomic integrity, the ability to interfere with TOP2 and generate enzyme-mediated DNA damage is an effective strategy for cancer chemotherapy.
