The Embedded Pcs Isa Bus

ISA Bus | Embedded System Technologies. ISA stands for Industry Standard Architecture. Most PCs contain ISA slot on the main board to connect either an 8-bit ISA card or a 16-bit ISA card. 32-bit cards are PCI cards. The ISA bus has evolved from its original 8-bit standard to 16-bit standard available in most PCs today.

The PC/XT-bus is an eight-bit ISA bus used by Intel 8086 and Intel 8088 systems in the IBM PC and IBM PC XT in the 1980s. Among its 62 pins were demultiplexed and electrically buffered versions of the 8 data and 20 address lines of the 8088 processor, along with power lines, clocks, read/write strobes, interrupt lines, etc. Power lines included -5 V and ±12 V in order to directly support ...

Industry Standard Architecture - Wikipedia

The PC/104 bus is, in essence, the ISA bus from the IBM personal computer AT and XT days. It is derived from the PC/AT (16-bit) and PC/XT (8-bit) bus specifications. The popularity of the PC/104 form factor is due to its compact board size, the incorporation of a mature open standard bus protocol (the ISA bus), and the vast number of diverse PC/104 modules available from a multitude of vendors.

The PC/104 bus - PC/104 and Small Form Factors

The PC/104 bus, used in industrial and embedded applications, is a derivative of the ISA bus and uses the same signal lines with different connectors. The Low Pin Count (LPC) bus has largely replaced the ISA bus as the connection to the legacy I/O (input/output) devices on modern motherboards. This was last updated in March 2020
